De Vinne Italic 6pt 1900 / native source

Version 1.001; printed page 349, archive leaf 357.

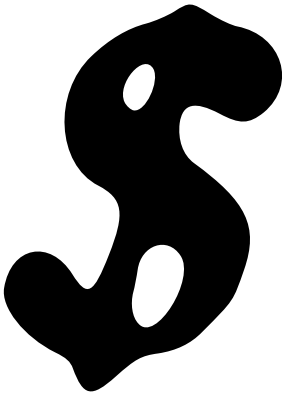

Historical American Type Founders specimen published in the United States in 1898; public domain by age.

Complete point-labelled setting; prices are excluded from character coverage.

Native crop; neighbouring ink remains visible.

Observed $; threshold 155; advance 650

The LOC six-point dollar before 2468, at threshold 155, retains both native apertures and the printed bar and terminal extents. Twelve independent capitals and ten flat-footed text anchors support scale and row alignment. The filled collective dollar and threshold 110 with a broken lower contour are rejected. Modern 35-unit sidebearings are used; no punctuation is invented.

The complete glyph is traced from one impression. No holes are filled, strokes drawn, outlines assembled from parts, or widths stretched. One measured scale and rigid rotation preserve source proportions and the historical italic slant.

Independent capital comparison

Black: retained canonical capitals. Red outline: source impressions at one uniform scale.

12 capitals; scale 21.840752; RMS 13.01 font units.

L / loc6-cap-30

Matching same-size optical design supported by common capitals and lowercase; no punch, matrix or first-casting identity claimed.

Threshold and contour comparison

Each trial uses the same independent capital scale and measured text-row baseline.

loc6-text-49

Threshold 170

2 closed counters

loc6-text-49

Threshold 190

2 closed counters

The lowest threshold breaks the lower contour. The selected threshold 155 retains two apertures and the observed bar and terminal extents.

Selected: loc6-text-49, threshold 155. Matching same-size optical design supported by common capitals and lowercase; no punch, matrix or first-casting identity claimed.

Desktop and web format comparison

Whole observed $; same source position and advance in all four delivery formats.

Existing advances and feature mappings are preserved. This font adds one observed dollar.

Native text baseline

Red: measured baseline through independent whole-letter anchors. Source pixels are enlarged for inspection.

10 anchors; slope -0.00495630; baseline intercept 3309.439875 native pixels. The target glyph does not determine its own vertical placement.

A rigid rotation corrects scan skew. No shear or individual width adjustment is applied. Source overshoots and printing differences remain visible.
